TRAFFIC CONTROL DEVICES

Cones (18") must be predominantly orange and be made of material that can be struck without causing damage to the impacting vehicle. Use only during daytime and on low-speed roadways, 40 mph or less. Cones may be doubled up to increase their weight.

Cones (28") are used on freeways and other high-speed highways or at night on all highways, or when more conspicuous guidance is needed. For nighttime use, cones must have two bands of retroreflective material.

DID YOU KNOW?

According to MUTCD flaggers and others providing temporary traffic control should wear high-visibility clothing with a background of fluorescent orange/red or yellow/green and retro-reflective material of orange, yellow, white, silver, or yellow/green. In areas of traffic movement, this personal protective equipment will make the worker visible for at least 1000', so that the worker can be seen from any direction, and make the worker stand out from the background. Check the label or packaging to ensure that the garments are performance class 2 or 3.

DID YOU KNOW?

ANSI/ISEA 107 provides the performance requirements for the materials used in high visibility PPE. These requirements focus on the color and brightness relative to the work environment, and use of fluorescent and retro-reflective materials. The standard also details three performance classes for garments based on the worker hazard and tasks, complexity of the work environment, and vehicular traffic and speed conditions.
